

Extraordinary People

... personalized care

Paul Hill
*Laboratory Assistant Director
Supervisor, Microbiology*

Paul Hill discovered his knack for science as a young child. As an adult, he uses his understanding of biology, chemistry and microbiology to help prevent, diagnose and treat disease. Whether it's a lipid panel, wound culture, or a PSA test to detect prostate cancer, the laboratory helps care providers see beyond what's visible to the human eye.

Paul says, "We analyze all the different body fluids. For example, when a physician draws blood or fluid out of an injured knee, they send us the sample and we provide them information that helps direct treatment.

"I like being part of the patient care team. I've worked in a big teaching hospital where the laboratory felt like an assembly line. At YVMC it's a much smaller environment where I can interact with the patients and care providers."
